

Customizing the Blockchain Explorer in BoV

Since there is a limitation in Blockchain Explorer (BE) that it can only monitor one channel at a time, users who want to monitor other channels can follow instructions in this document.

Prerequisites:

- You need to create the channel manually and join the peers for the channel.

In this guide we will demonstrate how to set up a customized Blockchain Explorer instance for a channel named "mychannel". It has two peers : peer0.org1-f-1:7051 and peer0.org2-f-1:7051 .

Peer0.org1-f-1 belongs to organization 1 and peer0.org2-f-1 belongs to organization 2.

Steps:

1. Enter /opt/share/resources folder and copy explorer-artifacts to explorer-artifacts-mychannel.

```
$> cd /opt/share/resources
```

```
$> cp explorer-artifacts explorer-artifacts-mychannel -rf
```

2. Enter explorer-artifacts-mychannel directory.

```
$> cd explorer-artifacts-mychannel
```

3. Edit config.json file.

- a. Change the channel name to "mychannel"

```
{
  "GOPATH": "/opt/gopath",
  "channel": "mychannel",
  "enableTls": false,
  "eventWaitTime": "30000",
  "host": "explorer",
  "keyValueStore": "/tmp/fabric-client-kvs",
  "mysql": {
    "database": "fabricexplorer",
    "host": "localhost",
    "passwd": "root",
    "port": "3306",
    "username": "root"
  },
  "network-config": {
    "orderer": {
```

Figure 1

- b. Modify organizations, in this example the peers belong to two organizations so we will list this two organizations' name here.

```

        "tls_cacerts": "/first-network/cryp
    }
}
},
"org": [
    "org1",
    "org2"
],
"peer": "peer0",
"port": "8080",
"users": [
    {
        "secret": "adminpw",
        "username": "admin"
    }
]
}

```

Figure 2

- c. Modify peers within these two organizations, each organization should only contain peers that belong to the channel. Here we only include peer0 for org1 and peer0 for org2.

```

"org1": {
  "admin": {
    "cert": "/first-network/crypto-config/peerOrganizations/org1-f-1/users/Admin@org1-f-1/msp/signcerts",
    "key": "/first-network/crypto-config/peerOrganizations/org1-f-1/users/Admin@org1-f-1/msp/keystore"
  },
  "ca": "http://ca.org1-f-1:7054",
  "mspid": "Org1MSP",
  "name": "peerorg1-f-1",
  "peer0": {
    "events": "grpc://peer0.org1-f-1:7053",
    "requests": "grpc://peer0.org1-f-1:7051",
    "server-hostname": "peer0.org1-f-1",
    "tls_cacerts": "/first-network/crypto-config/peerOrganizations/org1-f-1/peers/peer0.org1-f-1/tls/ca.crt"
  }
},
"org2": {
  "admin": {
    "cert": "/first-network/crypto-config/peerOrganizations/org2-f-1/users/Admin@org2-f-1/msp/signcerts",
    "key": "/first-network/crypto-config/peerOrganizations/org2-f-1/users/Admin@org2-f-1/msp/keystore"
  },
  "ca": "http://ca.org2-f-1:7054",
  "mspid": "Org2MSP",
  "name": "peerorg2-f-1",
  "peer0": {
    "events": "grpc://peer0.org2-f-1:7053",
    "requests": "grpc://peer0.org2-f-1:7051",
    "server-hostname": "peer0.org2-f-1",
    "tls_cacerts": "/first-network/crypto-config/peerOrganizations/org2-f-1/peers/peer0.org2-f-1/tls/ca.crt"
  }
}

```

Figure 3

4. Edit fabric_1_0_explorer.yaml.

- a. Rename PersistentVolume name to explorer-mychannel-pv as Figure 4 shows.

```

---
apiVersion: v1
kind: PersistentVolume
metadata:
  name: explorer-mychannel-pv
spec:
  capacity:
    storage: 500Mi
  accessModes:
    - ReadWriteMany
  nfs:
    path: /opt/share/resources/
    server: 10.160.40.95 # change to your nfs server ip here.
---

```

Figure 4

- b. Rename PersistentVolumeClaim name to explorer-mychannel-pv as Figure 5 shows.

```

apiVersion: v1
kind: PersistentVolumeClaim
metadata:
  # namespace: explorer
  name: explorer-mychannel-pv
spec:
  accessModes:
    - ReadWriteMany
  resources:
    requests:
      storage: 10Mi

```

Figure 5

- c. Rename pod name to fabric-mychannel-explorer as Figure 6 shows.

```

apiVersion: extensions/v1beta1
kind: Deployment
metadata:
  # namespace: explorer
  name: fabric-mychannel-explorer
spec:
  replicas: 1
  strategy: {}
  template:
    metadata:
      labels:
        app: explorer
    spec:
      containers:
        - name: mysql
          image: mysql:5.7
          ports:
            - containerPort: 3306
          env:
            - MYSQL_ROOT_PASSWORD

```

Figure 6

- d. Replace config file mount path and modify volume configuration as Figure 7 shows.

```
    app: explorer
spec:
  containers:
    - name: mysql
      image: mysql:5.7
      ports:
        - containerPort: 3306
      env:
        - name: MYSQL_ROOT_PASSWORD
          value: root
        - name: MYSQL_DATABASE
          value: fabricexplorer
      volumeMounts:
        - mountPath: /docker-entrypoint-initdb.d/fabricexplorer.sql
          name: explorer-resources
          subPath: explorer-artifacts-mychannel/fabricexplorer.sql

    - name: fabric-explorer
      imagePullPolicy: IfNotPresent
      image: vmware/fabric-explorer:1.0
      command: [ "/bin/bash", "-c", "--" ]
      args: ["sleep 10;node main.js 2>&1"]
      ports:
        - containerPort: 8080
      volumeMounts:
        - mountPath: /blockchain-explorer/config.json
          name: explorer-resources
          subPath: explorer-artifacts-mychannel/config.json
        - mountPath: /blockchain-explorer/first-network/crypto-config
          name: explorer-resources
          subPath: crypto-config
  volumes:
    - name: explorer-resources
      persistentVolumeClaim:
        claimName: explorer-mychannel-pv
```

Figure 7

- e. Rename service name and port number.

```
apiVersion: v1
kind: Service
metadata:
  # namespace: explorer
  name: fabric-mychannel-explorer
spec:
  selector:
    app: explorer
  type: NodePort
  ports:
    - name: explorer-mychannel-server
      protocol: TCP
      port: 8080
      targetPort: 8080
      nodePort: 32766
```

Figure 8

Note: by default, explorer for default channel uses port 32767 as the endpoint, you need to choose other port.

5. Run the following command to start up the services

```
$> kubectl create -f fabric_1_0_explorer.yaml
```

6. View the status of the new BE pod

```
$> kubectl get pods --all-namespaces
```

```
root@nfs:/opt/share/resources/explorer-artifacts-mychannel# kubectl get pod --all-namespaces
NAMESPACE      NAME                                                    READY   STATUS    RESTARTS   AGE
default        fabric-explorer-3871271660-sr5n7                      2/2     Running   0          16m
default        fabric-mychannel-explorer-3925669552-0xglw             2/2     Running   0          12m
kube-system    etcd-server-master                                    1/1     Running   0          22h
kube-system    heapster-v1.2.0-867844254-sx641                      2/2     Running   2          22h
kube-system    kube-apiserver-master                                 1/1     Running   0          22h

kube-system    kube-dns-v19-9sjf8                                    3/3     Running   0          19h
kube-system    kube-proxy-dr5j4                                       1/1     Running   1          22h
kube-system    kube-proxy-vp39w                                       1/1     Running   0          22h
kube-system    kube-proxy-xzszf                                       1/1     Running   1          22h
kube-system    kube-scheduler-master                                1/1     Running   0          22h
kube-system    kubernetes-dashboard-1019458639-rchwc                 1/1     Running   0          20h
ordererorg-f-1 orderer0-ordererorg-f-1-3682888393-n9kbv              1/1     Running   0          17m
org1-f-1       ca-1141794258-7ptp8                                   1/1     Running   0          16m
org1-f-1       cli-1456865810-gqh4q                                  1/1     Running   0          16m
org1-f-1       peer0-org1-f-1-699182850-x6dxr                       2/2     Running   0          16m
org1-f-1       peer1-org1-f-1-2366549771-tnl3b                      2/2     Running   0          16m
org2-f-1       ca-4100941246-zrgbx                                   1/1     Running   0          17m
org2-f-1       cli-2786066968-q3cv1                                  1/1     Running   0          17m
org2-f-1       peer0-org2-f-1-2990452493-mpr4t                      2/2     Running   0          16m
org2-f-1       peer1-org2-f-1-363835158-2tk8v                      2/2     Running   0          16m
```

Figure 9

7. You can get the BE's IP address and port with the following steps:

- a. Get Node IP address

```
$> kubectl describe pod fabric-mychannel-explorer --namespace=default | grep Node |
sed -n 1p | awk -F '/' '{print $2}'
```

```
root@nfs:/work/baas/setupCluster#
root@nfs:/work/baas/setupCluster# kubectl describe pod fabric-mychannel-explorer --namespace=default | grep Node | sed -n 1p | awk -F '/' '{print $2}'
10.192.210.119
root@nfs:/work/baas/setupCluster#
root@nfs:/work/baas/setupCluster#
```

Figure 10

- b. Get explorer port

```
$> kubectl describe service fabric-mychannel-explorer --namespace=default | grep -i
NodePort | sed -n 2p | awk -F ' ' '{print $3}' | awk -F '/' '{print $1}'
```

```

root@nfs:~/work/baas/setupCluster#
root@nfs:~/work/baas/setupCluster#
root@nfs:~/work/baas/setupCluster# kubectl describe service fabric-mychannel-explorer --namespace=default | grep -i NodePort | sed -n 2p | awk -F ' ' '{print $3}' | awk
-F '//' '{print $1}'
32766
root@nfs:~/work/baas/setupCluster#
root@nfs:~/work/baas/setupCluster#
root@nfs:~/work/baas/setupCluster#

```

Figure 11

Now, You can view BE with address <http://10.192.210.119:32766> .
